

Untitled

1. The main advantage to using Selenium is the ability to simulate user inputs on a webpage.

This automated test program will allow an automated test to work on multiple different browsers.

2. Limitation in terms of browser support (It runs only in Mozilla), can't run recorded script if it is converted to Java, C#, Ruby etc., not allowed to write manual scripts like conditions and Loops for Data, no option to verify images.

3. `<table id="suiteTable" cellpadding="1" cellspacing="1" border="1" class="selenium"><tbody>
<tr><td>MyCase</td></tr>
<tr><td>MyCase</td></tr>
</tbody></table>`

4. `<tr>
<td>click</td>
<td>//a[@id='myLink']</td>
<td></td>
</tr>`

5. Since Selenium is used to test web based applications using HTML for test cases allows for an easy transition into the test. Also you can test the same functions if both test and application are written in the same language. This allows for an easy transition.
